Background:	Synonyms: Frequently rearranged in advanced T-cell lymphomas 2 antibodyGSK-3 binding
	protein FRAT2, FRAT2_HUMAN.
	Background: FRAT1 and FRAT2 were originally characterized as proteins frequently rearranged
	in advanced T cell lymphoma, and they have since been identified as proto-oncogenes involved
	in tumorigenesis. These proteins share significant homology with the Xenopus glycogen
	synthase kinase-3 (xGSK-3) binding protein, which is designated GBP and is essential for the
	formation of the dorsal-ventral axis during embryonic development. Establishment of these
	embryonic axes is mediated by the Wnt intracellular signaling pathway. Wnt signaling is
	regulated in part by the activity of GSK-3, which phosphorylates and thereby facilitates the
	degradation of ?catenin. GBP binds to GSK-3 and inhibits this phosphorylation, resulting in the
	accumulation of ?catenin and the subsequent transcription of Wnt target genes. Like GBP,
	FRAT2 has been shown to bind xGSK-3, suggesting that FRAT1 and FRAT2 may be GSK-3
	regulatory proteins.
