membrane spanning domains, Transmembrane protein 16C, ANO3_HUMAN.	
Background: TMEM16C is a 981 amino acid multi-pass membrane protein that is	encoded by a
gene which maps to chromosome 11. With approximately 135 million base pairs a	and 1,400
genes, chromosome 11 makes up around 4 % of human genomic DNA and is con	sidered a
gene and disease association dense chromosome. The chromosome 11 encoded	Atm gene is
important for regulation of cell cycle arrest and apoptosis following double strand	DNA breaks.
Atm mutation leads to the disorder known as ataxia-telangiectasia. The blood diso	orders Sickle
cell anemia and thalassemia are caused by HBB gene mutations, while Wilms' tun	nors, WAGR
syndrome and Denys-Drash syndrome are associated with mutations of the WT1	gene. Jervell
and Lange-Nielsen syndrome, Jacobsen syndrome, Niemann-Pick disease, heredi	tary
angioedema and Smith-Lemli-Opitz syndrome are also associated with defects in	chromosome
11.
