| | Background: Bcl-6, a transcriptional repressor, binds Stat recognition-like DNA elements and | |
| | influences germinal center development and cell differentiation. Additionally, Bcl-6 negatively | |
| | regulates NF_B expression, thereby inhibiting NF_B-mediated cellular functions. Bcl-6b (B-cell | |
| | CLL/lymphoma 6, member B), also known as ZNF62, BAZF or ZBTB28, is a 480 amino acid | |
| | nuclear protein that contains one BTB (POZ) domain and five C2H2-type zinc fingers. Expressed | |
| | ubiquitously with highest expression in placenta and heart, Bcl-6b associates with Bcl-6 and | |
| | functions as a sequence-specific transcriptional repressor that is thought to be necessary for | |
| | early B-cell development. The gene encoding Bcl-6b maps to human chromosome 17, which | |
| | comprises over 2.5 % of the human genome and encodes over 1,200 genes. | |
