	Background: Chromosome 9 consists of about 145 million bases and 4 % of the human
	genome and encodes nearly 900 genes. Considered to play a role in gender determination, deletion of the distal portion of 9p can lead to development of male to female sex reversal, the
	phenotype of a female with a male X,Y genotype. Hereditary hemorrhagic telangiectasia, which
	is characterized by harmful vascular defects, is associated with the chromosome 9 gene
	encoding endoglin protein, ENG. Familial dysautonomia is also associated with chromosome 9
	though through the gene IKBKAP. Notably, chromosome 9 encompasses the largest interferon
	family gene cluster. Chromosome 9 is partnered with chromosome 22 in the translocation
	leading to the aberrant production of BCR-ABL fusion protein often found in leukemias. The
	C9orf50 gene product has been provisionally designated C9orf50 pending further
	characterization.
