	protein coupled receptor 110, G-protein coupled receptor KPG_012, G-protein coupled receptor	
	PGR19, ADGRF1	
	Background: G protein-coupled receptors (GPRs), also known as seven transmembrane	
	receptors, heptahelical receptors or 7TM receptors, comprise a superfamily of proteins that	
	play a role in many different stimulus-response pathways. G protein coupled receptors translate	
	extracellular signals into intracellular signals (G protein activation) and they respond to a variety	
	of signaling molecules, such as hormones and neurotransmitters. GPR110 (G protein-coupled	
receptor 110), also known as PGR19, is a 911 amino acid protein that belongs to the		
coupled receptor 2 family and LN-TM7 subfamily. Characterized as an adhesion GPCI		
	is a multipass membrane-bound protein with a long amino-terminus that contains multiple	
	domains. One of these domains is the GPCR proteolytic site (GPS), which is essential for	
	proteolytic cleavage of the amino-terminus and for cell surface expression.
