Target Details

Background:	<p>Synonyms: C8orf58, CH058_HUMAN, Chromosome 8 open reading frame 58, Uncharacterized protein C8orf58.</p> <p>Background: C8orf58 (chromosome 8 open reading frame 58) is a 365 amino acid protein that exists as two alternatively spliced isoforms, which are encoded by a gene that maps to human chromosome 8p21. Consisting of nearly 146 million bases, chromosome 8 encodes about 800 genes. Translocation of portions of chromosome 8 with amplifications of the c-Myc gene are found in some leukemias and lymphomas, and are typically associated with a poor prognosis. Portions of chromosome 8 have been linked to schizophrenia and bipolar disorder. Trisomy 8, also known as Warkany syndrome 2, most often results in early miscarriage but is occasionally seen in a mosaic form in surviving patients who suffer to a varying degree from a number of symptoms including retarded mental and motor development, and certain facial and developmental defects. WRN is a DNA helicase encoded by chromosome 8 and shown defective in those with the early aging disorder Werner syndrome. Chromosome 8 is also associated with Pfeiffer syndrome, congenital hypothyroidism and Waardenburg syndrome.</p>
