	subunit alpha-1B, Brain calcium channel III, Calcium channel, L type, alpha-1 polypeptide
	isoform 5, Voltage-gated calcium channel subunit alpha Cav2.2, CACNA1B, CACH5
	Background: Voltage-sensitive calcium channels (VSCC) mediate the entry of calcium ions into
	excitable cells and are also involved in a variety of calcium-dependent processes, including
	muscle contraction, hormone or neurotransmitter release, gene expression, cell motility, cell
	division and cell death. The isoform alpha-1B gives rise to N-type calcium currents. N-type
	calcium channels belong to the 'high-voltage activated' (HVA) group and are blocked by omega-
	conotoxin-GVIA (omega-CTx-GVIA) and by omega-agatoxin-IIIA (omega-Aga-IIIA). They are
	however insensitive to dihydropyridines (DHP), and omega-agatoxin-IVA (omega-Aga-IVA).
	Calcium channels containing alpha-1B subunit may play a role in directed migration of
	immature neurons.
