protein 2, Growth arrest-specic protein 2, MGC32610.
Background: Gas2 is a 313 amino acid protein encoded by the human gene GAS2. Gas2 is
thought to play a role in apoptosis by acting as a cell death substrate for caspases. Gas2, a
component of the microfilament system, is cleaved by a caspase (caspase-3 and caspase-7) at
Asparagine 278 during apoptosis. The cleaved form resulting from this dramatically induces
the rearrangement of the Actin cytoskeleton and causes potent changes in the shape of the
affected cells. Gas2 is believed to also be involved in the membrane ruffling process. During the
G0-G1 transition phase Gas2 can be found phosphorylated on its serine residues. Gas2 is a
cytoskeleton and peripheral membrane protein that co-localizes with Actin fibers at the cell
border and along the stress fibers in growth-arrested fibroblasts. Gas2 is mainly membrane-
associated but when hyperphosphorylated it will accumulate at membrane ruffles. Gas2 is
specifically expressed at growth arrest and is ubiquitously expressed with highest levels found
in liver, lung and kidney. There is no evidence, however, of Gas2 expression in spleen.
