	protein coupled receptor 34.
	Background: G protein-coupled receptors (GPRs), also known as seven transmembrane
	receptors, heptahelical receptors or 7TM receptors, comprise a superfamily of proteins that
	play a role in many different stimulus-response pathways. GPR signaling is an evolutionarily
	ancient mechanism used by all eukaryotes to sense environmental stimuli and mediate cell-cell
	communication. G protein-coupled receptors translate extracellular signals into intracellular
	signals (G protein activation) and they respond to a variety of signaling molecules, such as
	hormones and neurotransmitters. GPR34 is a 381 amino acid protein belonging to the G-protein
	coupled receptor 1 family. Widely expressed, GPR34 is localized to the cell membrane.
