Background:	Synonyms: OSA2, 6A3-5, DAN15, MRD12, P250R, BRIGHT, BAF250B, ELD/OSA1, AT-rich
	interactive domain-containing protein 1B, ARID domain-containing protein 1B, BRG1-associated
	factor 250b, BRG1-binding protein hELD/OSA1, Osa homolog 2, hOsa2, ARID1B, KIAA1235
	Background: Involved in transcriptional activation and repression of select genes by chromatin
	remodeling (alteration of DNA-nucleosome topology). Belongs to the neural progenitors-
	specific chromatin remodeling complex (npBAF complex) and the neuron-specific chromatin
	remodeling complex (nBAF complex). During neural development a switch from a
	stem/progenitor to a post-mitotic chromatin remodeling mechanism occurs as neurons exit the
	cell cycle and become committed to their adult state. The transition from proliferating neural
	stem/progenitor cells to post-mitotic neurons requires a switch in subunit composition of the
	npBAF and nBAF complexes. As neural progenitors exit mitosis and differentiate into neurons,
	npBAF complexes which contain ACTL6A/BAF53A and PHF10/BAF45A, are exchanged for
	homologous alternative ACTL6B/BAF53B and DPF1/BAF45B or DPF3/BAF45C subunits in
	neuron-specific complexes (nBAF). The npBAF complex is essential for the self-
	renewal/proliferative capacity of the multipotent neural stem cells. The nBAF complex along
	with CREST plays a role regulating the activity of genes essential for dendrite growth (By
	similarity). Binds DNA non-specifically.
