Target Details

Background:	Synonyms: Cartilage associated protein, LEPREL3, leprecan-like 3, CASP, CRTAP_HUMAN.
	Background: CRTAP is a secreted protein localizing to the extracellular space that plays a role in
	collagen post-translational modifications, extracellular fibril assembly and intracellular
	trafficking. CRTAP is widely expressed with predominant expression in articular chondrocytes.
	It contains a signal peptide and a tetratricopeptide-like helical domain and is essential for
	normal bone formation. In the endoplasmic reticulum (ER), CRTAP forms a complex with Gros1
	and CyPB (cyclophilin B) and is required for the efficient 3-hydroxylation of target prolyl residues
	in Collagen Type I molecules, the major structural proteins of skin and bone. Mutations in the
	gene encoding CRTAP can lead to autosomal recessive osteogenesis imperfecta (OI) type 7
	and type 2B. OI, also known as brittle bone disease, is characterized by bone fragility and
	susceptibility to fractures. OI type 7 is a mild form of this disorder, while OI type 2B is a neonatal
	lethal condition.
