	Background: Microtubules mediate the spatial organization of diverse membrane-trafficking	
	systems. The HOOK proteins, HOOK1, HOOK2 and HOOK3, comprise a family of cytosolic	
	coiled-coil proteins that contain conserved N-terminal domains, which attach to microtubules,	
	and more divergent C-terminal domains, which mediate binding to organelles. HOOK1, a	
	cytoskeletal linker protein, may play a role in endocytic membrane trafficking. It exists as a	
	homodimer, most likely mediated through its central coiled-coil domain. HOOK1 interacts with	
	VPS18 and is required for spermatid differentiation, in which it is most likely involved in the	
	positioning of the manchette microtubules and the flagellum. HOOK1 localizes primarily to the	
	cytoplasm and does not associate with the Golgi complex, unlike HOOK3, which participates in	
	the organization of the cis-Golgi compartment.
