| Background: GBGT1 is a 347 amino acid single-pass type II membrane protein that belongs to |
| the glycosyltransferase 6 family. Localizing to the golgi apparatus membrane, GBGT1 is widely |
| expressed, with high levels found in placenta, ovary and peripheral blood leukocyte, and lower |
| levels expressed in liver, thymus and testis. GBGT1 utilizes manganese as a cofactor, and |
| assists in the addition of N-acetylgalactosamine (GalNAc) in alpha-1,3-linkage to various |
| substrates, resulting in the formation of glycolipids. Glycolipids are present in most eukaryotic |
| cells and may assist in the adherence of certain pathogens. Existing as two alternatively spliced |
| isoforms, the gene encoding GBGT1 maps to human chromosome 9q34.2 and mouse |
| chromosome 2 A3. |
