Background: This gene encodes a member of the filamin family. The encoded protein interacts with glycoprotein lb alpha as part of the process to repair vascular injuries. The platelet glycoprotein lb complex includes glycoprotein lb alpha, and it binds the actin cytoskeleton. Mutations in this gene have been found in several conditions: atelosteogenesis type 1 and type 3, boomerang dysplasia, autosomal dominant Larsen syndrome, and spondylocarpotarsal synostosis syndrome. Multiple alternatively spliced transcript variants that encode different protein isoforms have been described for this gene. [provided by RefSeq, Nov 2009]. |
