	complex protein 76p gene, Gamma tubulin ring complex protein, GCP 4, GCP4, h76p, hGCP4,
	Hgrip76, TUBGCP 4, TUBGCP4, Tubulin gamma complex associated protein 4, GCP4_HUMAN.
	Background: The gamma-Tubulin complex is composed of gamma Tubulin and the gamma-
	Tubulin complex-associated proteins GCP2, GCP3, GCP4, GCP5 and GCP6, all of which are
	essential components of microtubule organizing centers. gamma-Tubulin complex
	components are localized to both the centrosome, where they are involved in microtubule
	nucleation, and to the cytoplasm, where they exist as soluble complexes that can be recruited
	to the centrosome as needed. Although the GCP proteins are related, they have distinct roles
	which contribute to the proper function of the gamma-Tubulin complex. GCP4 (gamma-tubulin
	complex component 4), also known as TUBGCP4, is a ubiquitously expressed 667 amino acid
	member of the gamma-Tubulin complex that localizes to the metaphase spindle during
	mitosis. In response to proteosome inhibition, GCP4 exhibits increased accumulation at the
	pericentiolar material where it participates in microtubule organization and nucleation.
