formylglycine-generating enzyme 1, FGE, FGly generating enzyme, MGC131853, Sulfatase
modying factor 1 [Precursor], Sulfatase-modying factor 1, SUMF1, SUMF1_HUMAN, UNQ3037.
Background: SUMF1 is a 374 amino acid alternatively spliced protein that localizes to the lumen
of the endoplasmic reticulum and belongs to the sulfatase-modifying factor family. Expressed
ubiquitously with highest expression in liver, kidney and pancreas, SUMF1 exists as either a
monomer, a homodimer or a heterodimer (with SUMF2) and functions to oxidize sulfatase
cysteine residues to an active FGIy residue, thereby playing an important role in sulfatase
activity. Defects in the gene encoding SUMF1 are the cause of multiple sulfatase deficiency
(MSD), a heterogeneous disorder characterized by metachromatic leukodystrophy,
mucopolysaccharidosis, chondrodysplasia punctata, hydrocephalus, ichthyosis, neurologic
deterioration and developmental delay.
