Background:	Synonyms: FLJ10458, NLE 1, Nle, Notchless gene homolog, Notchless homolog 1 Drosophila,
	Notchless homolog 1, Notchless protein homolog 1, NLE1_HUMAN.
	Background: The Notch signaling pathway is an evolutionary conserved system that is involved
	in intracellular communication. Notch receptors play an important role in development and cell-
	fate decisions. Notchless is a loss-of-function mutant allele that encodes for protein NLE1
	(notchless homolog 1). NLE1 is a 485 amino acid WD40-repeat protein that binds to the
	cytoplasmic domain of Notch, regulating its signaling activity in Drosophila melanogaster and
	in mice. Deletion of the NLE1 gene in mice during the early stages of development results in
	embryonic death, while gene deletion in the late stages of development leads to activation of a
	caspase-3-dependent apoptotic pathway. In plants, NLE1 is crucial for normal cellular growth
	and development. Under-expression during shoot proliferation causes pleiotropic defects such
	as delayed flowering and abnormal organ maturation. It may also play a role in 60S ribosomal
	subunit biogenesis in yeast. NLE1 contains eight WD40 domains and produces one isoform
	due to alternative splicing.
