	Background: The product encoded by this gene is involved in the maintenance of iron
	homeostasis, and it is necessary for the regulation of iron storage in macrophages, and for
	intestinal iron absorption. The preproprotein is post-translationally cleaved into mature peptides
	of 20, 22 and 25 amino acids, and these active peptides are rich in cysteines, which form
	intramolecular bonds that stabilize their beta-sheet structures. These peptides exhibit
	antimicrobial activity. Mutations in this gene cause hemochromatosis type 2B, also known as
	juvenile hemochromatosis, a disease caused by severe iron overload that results in
	cardiomyopathy, cirrhosis, and endocrine failure. [provided by RefSeq, Jul 2008].
