Target Details	
Background:	Synonyms: Chromosome 6 open reading frame 136, Uncharacterized protein C6orf136, CF136_HUMAN.
	Background: Making up nearly 6 % of the human genome, chromosome 6 contains around
	1,200 genes within 170 million base pairs of sequence. Deletion of a portion of the q arm of
	chromosome 6 is associated with early onset intestinal cancer suggesting the presence of a
	cancer susceptibility locus. Porphyria cutanea tarda is associated with chromosome 6 through
	the HFE gene which, when mutated, predisposes an individual to developing this porphyria.
	Notably, the PARK2 gene, which is associated with Parkinson's disease, and the genes
	encoding the major histocompatiblity complex proteins, which are key molecular components
	of the immune system and determine predisposition to rheumatic diseases, are also located on
	chromosome 6. Stickler syndrome, 21-hydroxylase deficiency and maple syrup urine disease
	are also associated with genes on chromosome 6. A bipolar disorder susceptibility locus has
	been identified on the q arm of chromosome 6. The C6orf136 gene product has been
	provisionally designated C6orf136 pending further characterization.
