Background: C3orf34 (chromosome 3 open reading frame 34), also known as MGC14126, is a

163 amino acid protein encoded by a gene that maps to human chromosome 3q29.

Chromosome 3 is made up of approximately 214 million bases encoding over 1,100 genes.

Notably, there is a chemokine receptor gene cluster and a variety of human cancer related loci

on chromosome 3. Particular regions of the chromosome 3 short arm are deleted in many

types of cancer cells. Key tumor suppressing genes on chromosome 3 encode apoptosis

mediator RASSF1, cell migration regulator HYAL1 and angiogenesis suppressor SEMA3B.

Marfan Syndrome, porphyria, von Hippel-Lindau syndrome, osteogenesis imperfecta and

Charcot-Marie-Tooth disease are a few of the numerous genetic diseases associated with

chromosome 3.
