	phosphatase 3, Glucose-6-phosphatase beta, SCN4, Ubiquitous glucose-6-phosphatase
	catalytic subunit-related protein, UGRP,
	Background: Glucose-6-phosphatase (G6Pase), is a multicomponent enzyme system that
	hydrolyzes glucose-6-phosphate (G6P) in the final step of gluconeogenesis and gluconeolysis.
	G6Pase localizes to the endoplasmic reticulum, and while liver, kidney, and intestine are the
	only tissues that express the first identified isoform, G6Pase-Alpha, a second form, designated
	G6Pase-Beta, contributes to blood glucose homeostasis in a wider range of tissues. G6Pase-
	Beta, also known as SCN4, UGRP or G6PC3 (glucose 6 phosphatase, catalytic, 3), is a 346
	amino acid endoplasmic reticulum multi-pass membrane protein that is involved in
	carbohydrate biosynthesis and the gluconeogenesis pathway. Inhibited by vanadate, G6Pase-
	Beta hydrolyzes GP6 to glucose in the endoplasmic reticulum. Due to its necessary involvement
	in normal glucose metabolism, G6Pase-Beta may play an integral role in diabetes and glycogen
	storage diseases (GSDs).
