Background: Rab proteins, a family of Ras-related small GTP-binding proteins, play a key role in	
regulating intracellular vesicle trafficking (1?). Rab GDP dissociation inhibitor (Rab GDI or GDI2)	
forms a soluble complex with Rab proteins and thereby prevents the exchange of GDP for GTP	
(1?). In mammals, there exist two major isoforms, Rab GDI alpha (also known as XAP-4) and	
Rab GDI beta (1,4). While the mammalian Rab GDI beta-genes are ubiquitously expressed, the	
Rab GDI ?genes are predominantly brain-specific (1). Since it is expressed predominantly in	
neural and sensory tissues, Rab GDI a may serve a specific function in neural signal	
transmission (5). The gene sequences for the Rab GDI proteins are extremely conserved in	
evolution, with substantial homology preserved across three eukaryotic kingdoms (5).
