	subfamily B member 2, DnaJ protein homolog 1, DNAJB2, Heat shock 40 kDa protein 3, Heat		
	shock protein J1, Heat shock protein neuronal DNAJ like 1, HSJ 1, HSJ1, HSPF3,		
	DNJB2_HUMAN.		
	Background: The DnaJ family is one of the largest of all the chaperone families and has evolved		
	with diverse cellular localization and functions. The presence of the J domain defines a protein		
	as a member of the DnaJ family. DnaJ heat shock induced proteins are from the bacterium		
	Escherichia coli and are under the control of the htpR regulatory protein. The DnaJ proteins play a critical role in the HSP 70 chaperone machine by interacting with HSP 70 to stimulate ATP		
	hydrolysis. The proteins contain cysteine rich regions that are composed of zinc fingers that		
	form a peptide binding domain responsible for the chaperone function. DnaJ proteins are		
	important mediators of proteolysis and are involved in the regulation of protein degradation,		
	exocytosis and endocytosis. DnaJB2 (DnaJ homolog subfamily B member 2), also known as		
	HSJ1 or HSPF3, is expressed almost exclusively in the brain, with the highest levels in the		
	frontal cortex and hippocampus. Two isoforms are produced due to alternative splicing.
