Background:	Synonyms: AMAM-1, AMAP-1, AMAP1, AMY-1-binding protein 1, DKFZp434N1415,	
	MYBPP_HUMAN, MYCBP-associated protein, Mycbpap.	
	Background: AMAP-1 (AMY-1-binding protein 1), also known as AMAM-1 or MYCBPAP (MYCBP	
	associated protein), is a 947 amino acid protein that is expressed specifically in testis and is	
	involved in spermatogenesis and synaptic processes. AMAP-1 colocalizes with MYCBP (AMY-	
	1) in cytoplasm and also localizes to membrane. The gene encoding AMAP-1 maps to human	
	chromosome 17, which comprises over 2.5 % of the human genome and encodes over 1,200	
	genes. Two key tumor suppressor genes are associated with chromosome 17, namely, p53 and	
	BRCA1. Tumor suppressor p53 is necessary for maintenance of cellular genetic integrity by	
	moderating cell fate through DNA repair versus cell death. Malfunction or loss of p53	
	expression is associated with malignant cell growth and Li-Fraumeni syndrome. Like p53,	
	BRCA1 is directly involved in DNA repair, though specifically it is recognized as a genetic	
	determinant of early onset breast cancer and predisposition to cancers of the ovary, colon,	
	prostate gland and fallopian tubes.	
Pathways:	Sensory Perception of Sound
