Rab5 activating protein 6, RAP6, GAPD1_HUMAN.
Background: GAPVD1 is a 1478 amino acid peripheral membrane protein that acts both as a
GTPase-activating protein (GAP) and a guanine nucleotide exchange factor (GEF). GAPVD1
participates in many processes such as insulin receptor internalization, Glut4 trafficking and
endocytosis. In addition, depletion of GAPVD1 leads to delayed EGFR degradation by mediating
receptor ubiquination through its RGD domain, suggesting that it may be an important mediator
of carcinogenesis resulting from Ras protein mutations. There are six isoforms of GAPVD1 that
are produced as a result of alternative splicing events.
