|          | Background: BTBD14A is a 587 amino acid protein that contains one BTB/POZ domain. The           |
|          | BTB/POZ domain mediates homomeric and heteromeric POZ-POZ interactions and is common            |
|          | to transcriptional regulators involved in chromatin modeling. In several BTB/POZ containing     |
|          | proteins, including BCL-6 and the promyelocytic leukemia zinc-finger (PLZF) oncoprotein, this   |
|          | domain interacts with the SMRT/N-CoR-mSin3A HDAC complex and is directly involved in            |
|          | repressing and silencing gene transcription. When this domain is deleted, as with the oncogenic |
|          | PLZF-RAR chimera of promyelocytic leukemias, this transcriptional repression is attenuated.     |
|          | This suggests that BTBD14A may play a role in transcription regulation.                         |
