Background: Microtubules mediate the spatial organization of diverse membrane-trafficking systems. The HOOK proteins, HOOK1, HOOK2 and HOOK3, comprise a family of cytosolic | | |
| | | | |
| | | | |
| | | | |
| | coiled-coil proteins that contain conserved N-terminal domains, which attach to microtubules, | | |
| | and more divergent C-terminal domains, which mediate binding to organelles. HOOK1, a | | |
| | cytoskeletal linker protein, may play a role in endocytic membrane trafficking. It exists as a homodimer, most likely mediated through its central coiled-coil domain. HOOK1 interacts with | | |
| | | | |
| | VPS18 and is required for spermatid differentiation, in which it is most likely involved in the | | |
| | positioning of the manchette microtubules and the flagellum. HOOK1 localizes primarily to the | | |
| | cytoplasm and does not associate with the Golgi complex, unlike HOOK3, which participates in | | |
| | the organization of the cis-Golgi compartment. | | |
