	Background: The protein encoded by this gene is the predominant constituent of the crystalline	
	core of the eosinophil granule. High levels of the proform of this protein are also present in	
	placenta and pregnancy serum, where it exists as a complex with several other proteins	
	including pregnancy-associated plasma protein A (PAPPA), angiotensinogen (AGT), and C3dg.	
	This protein may be involved in antiparasitic defense mechanisms as a cytotoxin and	
	helminthotoxin, and in immune hypersensitivity reactions. It is directly implicated in epithelial	
	cell damage, exfoliation, and bronchospasm in allergic diseases. Alternatively spliced transcript	
	variants encoding different isoforms have been found for this gene. [provided by RefSeq, Aug	
	2011].
