	Background: Emp is a 396 amino acid ubiquitously expressed adhesion protein. Expressed as 5	
	alternatively spliced isoforms, Emp contains one CTLH domain and one LisH domain. Emp can	
	form a complex with F-actin, which is involved regulating actin distribution in erythroblasts and	
	macrophages. Considered to assist with cell division and nuclear architecture, Emp is localized	
	with condensed chromatin at prophase, nuclear spindle poles at metaphase and in the	
	contractile ring during telophase and cytokinesis. Although the exact function of Emp is	
	unknown, Emp is suggested to be involvement in erythroblast-macrophage cell attachment,	
	terminal maturation and enucleation of erythroid cells, and inhibiting apoptosis of erythroblasts.
