	Background: DMWD is a 674 amino acid protein containing five WD repeats. DMWD may play a
	role in the development of mental symptoms in severe cases of myotonic dystrophy, a chronic
	multisystemic disease characterized by wasting of the muscles, heart conduction defects,
	cataracts, endocrine changes and myotonia. The DMWD gene is located upstream of the DMPK
	gene and is prominently expressed in tissues affected in myotonic dystrophy patients. DMWD
	may also contribute to regulation in meiosis. DMWD is expressed in kidney and spleen, with
	strongest expression in brain, liver and testis. The gene encoding DMWD maps to human
	chromosome 19q13.32 and mouse chromosome 7 A3.
