	Background: Caldesmon, Filamin 1, Nebulin, Plastin, ADF, Gelsolin, CapG, Dematin and Cofilin
	are differentially expressed Actin-binding proteins. Both muscular (CDh) and non-muscular
	(CD1) forms of Caldesmon bind to Actin as well as to Calmodulin and Myosin. CDh is
	expressed predominantly on thin filaments in smooth muscle, whereas CD1 is widely
	expressed in non-muscle tissues and cells. CapG, also designated Actin-regulatory protein and
	macrophage-capping protein, is a macrophage-specific protein that reversibly blocks the
	barbed ends of Actin filaments, but does not sever preformed ones. The interactions of CapG
	with Actin may be important in the regulation of nuclear and cytoplasmic structures. CapG is a
	calcium-sensitive DNA-binding protein that plays a role in macrophage function. It is expressed
	in macrophages and macrophage-like cells and can localize both to the nucleus and the
	cytoplasm.
