	Background: Rho GTPases play a fundamental role in numerous cellular processes that are
	initiated by extracellular stimuli that work through G protein coupled receptors. The encoded
	protein may form a complex with G proteins and stimulate Rho-dependent signals. A similar
	protein in rat interacts with glutamate transporter EAAT4 and modulates its glutamate
	transport activity. Expression of the rat protein induces the reorganization of the actin
	cytoskeleton and its overexpression induces the formation of membrane ruffling and filopodia.
	Two alternative transcripts encoding different isoforms have been described. [provided by
	RefSeq, Jul 2008].
Pathways:	Neurotrophin Signaling Pathway, Regulation of G-Protein Coupled Receptor Protein Signaling
