|                     | Background: Guanine nucleotide-binding proteins (G proteins) are involved as modulators or                         |  |
|                     | transducers in various transmembrane signaling systems. The G(i) proteins are involved in                          |  |
|                     | hormonal regulation of adenylate cyclase: they inhibit the cyclase in response to beta-                            |  |
|                     | adrenergic stimuli. The inactive GDP-bound form prevents the association of RGS14 with                             |  |
|                     | centrosomes and is required for the translocation of RGS14 from the cytoplasm to the plasma                        |  |
|                     | membrane. May play a role in cell division.  |  |
