| Background: The product encoded by this gene is involved in the maintenance of iron  |
| homeostasis, and it is necessary for the regulation of iron storage in macrophages, and for  |
| intestinal iron absorption. The preproprotein is post-translationally cleaved into mature peptides   |
| of 20, 22 and 25 amino acids, and these active peptides are rich in cysteines, which form  |
| intramolecular bonds that stabilize their beta-sheet structures. These peptides exhibit  |
| antimicrobial activity. Mutations in this gene cause hemochromatosis type 2B, also known as  |
| juvenile hemochromatosis, a disease caused by severe iron overload that results in   |
| cardiomyopathy, cirrhosis, and endocrine failure. [provided by RefSeq, Jul 2008].  |
