	Background: Acetyl-CoA carboxylase (ACC) is a complex multifunctional enzyme system. ACC	
	is a biotin-containing enzyme which catalyzes the carboxylation of acetyl-CoA to malonyl-CoA,	
	the rate-limiting step in fatty acid synthesis. There are two ACC forms, alpha and beta, encoded	
	by two different genes. ACC-alpha is highly enriched in lipogenic tissues. The enzyme is under	
	long term control at the transcriptional and translational levels and under short term regulation	
	by the phosphorylation/dephosphorylation of targeted serine residues and by allosteric	
	transformation by citrate or palmitoyl-CoA. Multiple alternatively spliced transcript variants	
	divergent in the 5' sequence and encoding distinct isoforms have been found for this gene.
