	Inositol polyphosphate multikinase, Ipmk, IPMK_HUMAN	
	Background: Inositol polyphosphate multikinase (IPMK) belongs to the inositol phosphokinase	
	(IPK) family and is characterized as having a broad substrate specificity. However, IPMK	
	displays a preference for inositol-1,4,5-trisphosphate (Ins(1,4,5)P3) and inositol 1,3,4,6-	
	tetrakisphosphate (Ins(1,3,4,6)P4). IPMK is ubiquitously expressed with the highest expression	
	in skeletal muscle, liver, placenta, lung, peripheral blood leukocytes, kidney, spleen and colon.	
	IPMK is localized to the nucleus, where it may play a role in the regulation of calcium release	
	from intracellular stores and has been implicated as a drug target for cancer therapies. The	
	gene encoding IPMK maps to human chromosome 10, which contains over 800 genes.	
	Notably, disorders linked to genes on chromosome 10 include Cowden syndrome, Cockayne	
	syndrome and Tetrahydrobiopterin deficiency.
