	guanylyltransferase, Fucose-1-phosphate guanylyltransferase, GDP beta L fucose
	pyrophosphorylase, GDP L fucose diphosphorylase, GDP L fucose pyrophosphorylase, GDP-L-
	fucose diphosphorylase, GDP-L-fucose pyrophosphorylase, GFPP.
	Background: Guanylyltransferase enzymes transfer one molecule of GTP to another molecule
	and also function in the transfer of guanosine nucleotides to sugar molecules. The
	carbohydrate moieties that are generated are covalently attached to cell surfaces and are
	necessary to ensure a surface contour that satisfies a variety of physiological roles. L-fucose is
	an important sugar in complex carbohydrates that is frequently found on plant and mammalian
	N-linked glycans. FPGT (Fucose-1-phosphate guanylyltransferase), also known as GFPP (GDP-
	L-fucose pyrophosphorylase), is a 594 amino acid cytoplasmic protein that catalyzes the
	formation of GDP-L-fucose from L-fucose-1-phosphate and GTP. FPGT functions to reutilize the
	L-fucose that is produced uopn glycoprotein and glycolipid turnover.
