domain-containing protein C6orf204, NY-BR-15, RP11-57K17.2, Serologically defined breast
cancer antigen NY-BR-15.
Background: Making up nearly 6 % of the human genome, chromosome 6 contains around
1,200 genes within 170 million base pairs of sequence. Deletion of a portion of the q arm of
chromosome 6 is associated with early onset intestinal cancer suggesting the presence of a
cancer susceptibility locus. Porphyria cutanea tarda is associated with chromosome 6 through
the HFE gene which, when mutated, predisposes an individual to developing this porphyria.
Notably, the PARK2 gene, which is associated with Parkinson's disease, and the genes
encoding the major histocompatiblity complex proteins, which are key molecular components
of the immune system and determine predisposition to rheumatic diseases, are also located on
chromosome 6. Stickler syndrome, 21-hydroxylase deficiency and maple syrup urine disease
are also associated with genes on chromosome 6. A bipolar disorder susceptibility locus has
been identified on the q arm of chromosome 6. The C6orf204 gene product has been
provisionally designated C6orf204 pending further characterization.
