| | Background: The nuclear pore complex (NPC) mediates bidirectional macromolecular traffic |
| | between the nucleus and cytoplasm in eukaryotic cells and is comprised of more than 100 |
| | different subunits. Many of the subunits belong to a family called nucleoporins (Nups), which |
| | are characterized by the presence of O-linked-N-acetylglucosamine moieties and a distinctive |
| | pentapeptide repeat (XFXFG). gp210, also known as Nup210 (nucleoporin 210 kDa) or POM210, |
| | is a 1,887 amino acid single-pass type I membrane protein that localizes to both the |
| | endoplasmic reticulum and to the nucleus, specifically within the NPC. Expressed ubiquitously |
| | with highest expression in pancreas, testis, lung, ovary and liver, gp210 functions as a |
| | nucleoporin that is capable of dimerization and is essential for the assembly, fusion and |
| | structural integrity of the NPC. gp210 exists as multiple alternatively spliced isoforms and is |
| | subject to post-translational phosphorylation. |
