|                     | Background: HEMK2 is a 214 amino acid protein that belongs to the methyltransferase         |
|                     | superfamily and exists as multiple alternatively spliced isoforms. The gene encoding HEMK2  |
|                     | maps to human chromosome 21, which houses approximately 300 genes and comprises             |
|                     | nearly 1.5 % of the human genome. Chromosome 21-associated disorders include Alzheimer's    |
|                     | disease, amyotrophic lateral sclerosis and, most notably, Down syndrome (also known as      |
|                     | trisomy 21).  |
