	Background: The inherited blindness associated protein, aryl hydrocarbon receptor interacting
	protein-like 1 (AIPL1), interacts with the cell cycle regulator protein NUB1. AIPL1 is crucial for
	protein folding and stabilization, as well as for protein trafficking. It localizes to the nucleus or
	cytoplasm and is highly expressed in the pineal gland and the retina. In the retina, AIPL1 is
	expressed in both developing cone and rod photoreceptors, but it is restricted to rod
	photoreceptors in the adult human retina. Defects in the gene encoding for AIPL1 can cause
	Leber congenital amaurosis type IV, an early-onset, inherited autosomal recessive disorder that
	results in childhood blindness.
