| | Background: Dyrk is the homolog of the Drosophila mnb (minibrain) gene, which is required for |
| | neurogenesis (13). Dyrk is a dual-specificity tyrosine kinase and serine/threonine kinase, which |
| | is itself regulated by tyrosine phosphorylation (1). Several mammalian Dyrk related proteins |
| | have been identified and are thought to compose a family of dual specificity protein kinases (4). |
| | Dyrk family members, including Dyrk1A (originally Dyrk), Dyrk1B, Dryk1C, Dyrk2, Dyrk3, Dyrk4A |
| | and Dyrk4B, are thought to be involved in diverse cellular functions (4). Dyrk1A is a candidate |
| | gene that may be involved in Downs syndrome, and it has been found to be somewhat |
| | overexpressed in Downs syndrome (1,5). Two isoforms of human fetal brain Dyrk2 exist: a |
| | deduced 528-amino acid protein and a protein containing 73 additional amino acids at the |
| | amino terminus (4). Dyrk3 is strongly expressed in testis, only after the onset of |
| | spermatogenesis, and very weakly expressed in spleen and adrenal gland (1). The genes which |
| | encode Dyrk2 and Dyrk3 map to human chromosomes 12 and 1q32, respectively (4). |
