	Background: ATP-binding cassette (ABC) transporters are an evolutionarily conserved family of	
	widely-expressed proteins that use ATP hydrolysis to catalyze the transport of various	
	molecules across extracellular and intracellular membranes. As the largest family of	
	transmembrane proteins, ABC genes comprise several subfamilies. Eukaryotic ABC	
	transporters are largely responsible for trafficking hydrophobic compounds either within the	
	cell, as part of a metabolic process, or outside the cell, for transport to other organs or for	
	secretion from the body. ABCF2 in particular plays a putative role in tumor suppression at	
	metastatic sites and in the endocrine pathway for breast cancer and may be a prognostic	
	marker for clear cell ovarian adenocarcinoma.
