	Background: Mammalian spermatogenesis is a complex developmental process. Mutations at
	multiple loci and in structurally and functionally disparate genes in the genome affect
	gametogenesis. The analysis of mutations has provided insight into biochemical pathways
	required for completion of this process. The basic protein on Y chromosome 2 gene (BPY2,
	also designated VCY2) is located in a frequently deleted azoospermia factor c region. Three
	copies (paralogs) of the BPY2 gene (BPY2A, BPY2B, BPY2C) reside in the AZFc region. BPY2
	protein expression is localized to the nuclei of spermatogonia, spermatocytes and round
	spermatids, but is absent from elongated spermatids. Impaired expression of BPY2 in infertile
	men suggests its involvement in male germ cell development. BPY2 interacts with MAP-1S,
	which shares homology with microtubule-associated proteins (MAPs), suggesting a role for
	BPY2 within the cytoskeletal network.
