	1C, Guanylyl cyclase activating protein 3, Guanylyl cyclase-activating protein 3,		
	GUC1C_HUMAN, GUCA1C.		
	Background: The intracellular stimulation of guanylate cyclase (GC) by calcium, a key event in		
	the recovery of the dark state of rod photoreceptors after exposure to light, is mediated by		
	guanylate cyclase-activating proteins (GCAP). GCAPs are calcium-binding proteins belonging to		
	the calmodulin superfamily and are specifically expressed in retina. GCAP3 (Guanylyl cyclase-		
	activating protein 3), also known as GUCA1C (Guanylate cyclase activator 1C), is a 209 amino		
	acid EF-hand calcium binding protein that is activated by the decrease in calcium from the		
	absorption of light by rhodopsin. Activation of GCAP3 leads to stimulation of guanylate cyclase		
	1 and 2 (GC1 and GC2), which increases cGMP concentration. Calcium sensitive regulation of		
	GC is essential in recovery of the rod receptor dark state following light exposure. There are two		
	isoforms of GCAP3 that are produced as a result of alternative splicing events.		
Gene ID:	9626		
Pathways:	Regulation of G-Protein Coupled Receptor Protein Signaling, Phototransduction
