	protein 6, Zinc finger and BTB domain-containing protein 6, Zinc finger protein 482, Zinc finger
	protein with interaction domain, ZNF 482, ZNF482.
	Background: Zinc-finger proteins contain DNA-binding domains and have a wide variety of
	functions, most of which encompass some form of transcriptional activation or repression. The
	majority of zinc-finger proteins contain a Kr_ppel-type DNA binding domain and a KRAB
	domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins.
	Zinc finger and BTB domain-containing protein 5 (ZBTB5) is a 677 amino acid member of the
	Kr_ppel C2H2-type zinc-finger protein family. Localized to the nucleus, ZBTB5 contains a BTB
	domain, also known as a POZ domain, which inhibits DNA binding and mediates homotypic and
	heterotypic dimerization. Characteristics of the BTB domain suggest that ZBTB5 functions as a
	transcription regulator.
