Target Details

Background:	Synonyms: SIP3, Gemin7, Gemin-7, GEMI7_HUMAN.
	Background: Gemin7 is a 131 amino acid protein encoded by the mouse gene Gemin7. Gemin7,
	along with Gemin6, is a significant component of the the large multiprotein human SMN
	complex. The SMN complex functions as an assembly machine for small nuclear
	ribonucleoproteins (snRNPs)-the major components of the spliceosome. The survival of motor
	neurons (SMN) protein, a product of the disease gene of the common neurodegenerative
	disease, spinal muscular atrophy, is also part of the SMN complex. Although Gemin6 and
	Gemin7 have no significant sequence similarity with Sm proteins, both adopt canonical Sm
	folds. Moreover, Gemin6 and Gemin7 exist as a heterodimer, and interact with each other via an
	interface similar to that which mediates interactions among the Sm proteins. The
	Gemin6/Gemin7 complex binds to Sm proteins and might help organize Sm proteins for
	formation of Sm rings on snRNA targets.
