Zbtb44, Zinc finger and BTB domain containing 44, Zinc finger and BTB domain-containing
protein 44, Zinc finger protein 851, ZNF851.
Background: Zinc-finger proteins contain DNA-binding domains and have a wide variety of
functions, most of which encompass some form of transcriptional activation or repression. The
majority of zinc-finger proteins contain a Kr_ppel-type DNA binding domain and a KRAB
domain, which is thought to interact with KAP1, thereby recruiting histone modifying protein.
ZBTB44 is a 570 amino acid member of the Kr_ppel C2H2-type zinc-finger protein family.
Localized to the nucleus, ZBTB44 contains a BTB domain, also known as a POZ domain, which
inhibits DNA binding and mediates homotypic and heterotypic dimerization. Characteristics of
the BTB domain suggest that ZBTB44 functions as a transcription regulator. Four isoforms of
ZBTB44 have been identified.
