subunit p25 like protein, Ribonuclease P/MRP 25 kDa subunit like, RNase P protein subunit like
p25, Rpp25 like protein, RPP25L, RP25L_HUMAN.
Background: C9orf23 (chromosome 9 open reading frame 23) is a 163 amino acid protein that
belongs to the histone-like Alba family and is encoded by a gene that maps to human
chromosome 9p13.3. Chromosome 9 consists of about 145 million bases, represents 4 % of
the human genome and encodes nearly 900 genes. Thought to play a role in gender
determination, deletion of the distal portion of 9p can lead to development of male to female
sex reversal, the phenotype of a female with a male X,Y genotype. Hereditary hemorrhagic
telangiectasia, which is characterized by harmful vascular defects, is associated with the
chromosome 9 gene encoding endoglin protein, ENG. Familial dysautonomia is also associated
with chromosome 9 though through the gene IKBKAP. Notably, chromosome 9 encompasses
the largest interferon family gene cluster. Chromosome 9 is partnered with chromosome 22 in
the translocation leading to the aberrant production of BCR-ABL fusion protein often found in
leukemias.
