Background:	Synonyms: i-6-16, I6, IFI6_HUMAN, Interferon alpha-inducible protein 6, Interferon-induced
	protein 6-16.
	Background: This gene was first identified as one of the many genes induced by interferon. The
	encoded protein may play a critical role in the regulation of apoptosis. A minisatellite that
	consists of 26 repeats of a 12 nucleotide repeating element resembling the mammalian splice
	donor consensus sequence begins near the end of the second exon. Alternatively spliced
	transcript variants that encode different isoforms by using the two downstream repeat units as
	splice donor sites have been described.
